cp-e™ xFlex™ Engine Mounts – Backing plate

After reports of bolts backing out from the cp-e™ xFlex™ engine mount for the driver side Mazdaspeed3 applications, we have released a bulletin recommending the use of Red Loctite to ensure secure assembly. In our tests – this has proven to work securely, and we have yet to see issues.

As an additional measure of safety for race applications we have designed a backing plate to be installed between the transmission bracket and the transmission. This plate ensures that bolts do not back out all the way and the mount assembly maintains integrity.

As with any aftermarket part – it is always recommended to periodically ensure that all bolts are tight and the components are functioning as designed.

The backing plate is meant as an additional, fool proof way to secure the engine mount. We are offering the plates free of charge* to original owners** of the xFlex™ Mazdaspeed3 driver side engine mount.

Regards,

The cp-e™ Team
